Backwards Time Travel Rules (other than ones a future government wouldn't already make:

1. You cannot go back to a point before Sunday, August 14th, 2011 at 12:00:00 midnight Eastern Daylight Time (under any circumstances)
2. You cannot build a time machine (sending a temporal reactor and preventing instructions from), Saturday, July 18th, 2020.
3. You cannot go back in time without it being GIS approved (A Temporal GIS approved) math scan and a relook at your memories to gain closure of your use ensuring this is what you really wanted), and to recognize the risks. (Don't worry it is math only and it wouldn't reveal anything you don't already know).
4. You have to be at least 16 years old to do something like this (You do still need to learn life lessons)
5. You cannot risk interfering with any protected territory. (Any non-regrettable memories, lives, etc.) or things any one person couldn't imagine life without are protected territory
6. There is a 20 year limit for going back in time (Not for sending technology or instructions back after a use is requested, however it is for between when a person who requested it wanted to go back in time and their destination)
7. You cannot go back in time if you have at least one biological offspring
8. You cannot risk erasing anyone or anything from existence

Protected territories (You also can't mention when they were invented):

1. TV shows (Episodes, and full scripts down to the very last detail)
2. Movies
3. Songs (all types of songs and music)
4. Board games
5. Video games
6. Sports statistics
7. Inventions of sports and types of games
8. FanFiction based and other media
9. YouTube history (if the video has reached at least 1,000 views)
10. Newspaper and news reported crimes
11. Advancements of technology
12. Commercials
13. Sports and TV show and other events
14. Choral concerts
15. Public concerts
16. Events
17. Famous history (like taught in school)
18. Famous biographies
19. Musicals
20. Books
21. Memes
22. Wikipedia based stuff
23. Board games

24. Clothing (Shirts, pants, and other stuff)
25. Food (and types of food)
26. Rule history
27. Legal history and legal case history
28. Technology advancement and development
29. Restaurant history
30. Inventions (Do not change the history of when it was invented)
31. Pop culture
32. Trends
33. Streaming services
34. Other invention dates
35. Personal history and common gossip

You can't mess with anything that is currently in production either (assuming you wish to do so before then):

August 14th 2011 and now:

1. Since there are historical, pop-culture, event type, and often gossip categories that makes everyone wonderful and happy that can't be messed with
2. You can't mess with stuff that connect to imdb, Etsy, YouTube, Facebook, etc. and you cannot mess with anything related to that
3. Obviously, you cannot mess with any pandemic within seven years and only if it's a major global one
4. Depending on what makes up the good memories of at least one person, you cannot risk messing with that. However, depending on if they care *when* it happened or if they could imagine life without it
5. You cannot mess with sports statistics, trade, financial stuff,
6. You cannot change the course of recorded history
7. You cannot mess with anything that someone benefited from (learned from)
8. You can prevent mistakes, but whether or not you can undo it depends on what good came out of it
9. The "Minutemen" clause. It is heavily important that if you were to undo mistakes, you cannot risk anything that led to new friendships (especially ones important to the other friendships).
10. The "Back To The Future" clause. You cannot mess with how people met, you can't go back to a time before you were born, and you can't mess with how couples (who had biological kids) met. However, if they regret how they met, then it is important
11. Depending on how attached people are to memories, stories, anything can remain important, you can't risk that of at least one person
12. If there is anything a person couldn't imagine life without, then you can't risk that memory for yourself or for anyone else
13. Sadly celebrities cannot go back in time and undo their careers,
14. Due to cause and effect patterns, anything that will lead to a butterfly effect, even by accident. or if it could be messed with, that needs to be protected. However it depends

on if it causes a new negative butterfly effect, or leads to something that people couldn't imagine life without
15. Public broadcasting news reports and history
16. You can't mess with census records

Exceptions:

1. If butterfly effects prove positive and you can't change that history, but if you do reach a positive butterfly effect and fully certain of a dream that everyone has fully gotten, that new history is changed but it remains untouched
2. Mental health loophole: Census records can change, however not after August 1st 2015, due to Every Witch Way Season 4. I think if you were to post that full season online it a way where it can't be removed or if that already happened, that would be protected territory. Also, since it falls under TV show categories,
3. Note that you cannot get rid of stuff in the past (unless already happy for at least one person), however

Oh, and once you reach a non-regrettable memory of any person, that and anything from it can't be messed with and we keep moving forward into the future.

Pandemic Rule:

1. If you are talking about the COVID-19 pandemic, you can only shorten it to July 11th 2020, no earlier, and you cannot risk any butterfly effects with it without an alternative
2. There is a seven year limit to when pandemics can be gotten rid of. Once seven years have passed since a pandemic started, it could be added to a history book which means it reaches protected territory

Oh, and in 24 hours, once you reach a point in the world where you say "What's best for everyone". That is when that full timeline becomes fully protected.

Now yes, you can prevent mistakes but each type of mistake and what you can learn from it is equally important. So if you do manage to make things right, you would need some alternative from learning through each mistake that must prove non-traumatizing to everyone involved. You can also give them the kind of help to eventually treat it like a lesson, so that if anything were to happen in the future, you can do so. And trauma prevention is helpful, but you will need some way to teach and learn from any of the mistakes everyone has learned from if you are going to take them away to help protect people you care about and make things right. And depending on what you could learn from it, you will need to find some alternative for it. But yes, cinema-therapeutic trauma prevention is one of the biggest request uses of backwards time travel.

And yes, I think any future government would regulate backwards time travel considering everything, but you would need alternatives of learning from everything you've learned from that wasn't publicly recorded and/or people could live without, if they were to be taken away.

Because we have a blanket date of Sunday, August 14th, 2011 it can be helpful then too. And yes, I will find other alternatives in moderation.

And yes, it is okay if changes happen especially for the better and small changes can be allowed depending on if people are willing to live with the consequences, especially if mistakes can be undone through it, but yes the way a person grows, develops, or what each person they needed to learn could change. And yes, if anyone learned from that (the right way), that can't be erased without an alternative.

Are you sure?
Yes.

You cannot risk lives, families, or any kind of butterfly effect that people couldn't imagine life without. That is what matters most with any of this. Changes can be allowed but only if they prove ethically in a better direction, and if they are small and undetectable. And you can't risk erasing anything that at least one person liked and couldn't imagine life without. You would need to list protected territories.

Now most of the time, if a use were to happen it would be selfless. However it can be selfish if you are:

- Doing the right thing for yourself (What's best for yourself as you psychologically recognize that)
- Not sabotaging anyone or anything else (unless you have reasonable proof that they'd ask for it or for some other good reason)
-

Sadly, you can't use it to prevent a person's death (or let that be your intention directly):

1. There

You also can't use it as a way to avoid learning life lessons.

And yes, any changes must be positive butterfly effects, and if any new fun like pranks, scaring, cutting class (this wouldn't be murder), games, etc. or new mistakes were to be made, it would need zero permanent damage that would be problematic to the rest of the timeline. And you cannot mess with a situation at least one person benefited from without an alternate solution that doesn't risk hurting anyone else. And once a person fully achieves their non-regrettable life, that history is protected.

And yes, I'm not saying changes in the past can't happen, but they would need to be approved based on if it messes with anyone or anything else.

Oh, one other thing. You cannot go back in time to commit any crimes that already exist including murder. If what you do risks you getting grounded or getting detention in a way you can handle, that is fine. And you cannot risk any physical hurt to yourself or others that is fatal (If you pull an arm or have fun wrestling where pain can easily be healed from, it can be allowed, but if it too high-risk, then you can't)

GIS Technology:

1. Math only
2. Memory name recall and consolidation will allow more of that stuff
3. NDA (Non-Disclosure Agreements), would need to be done first with any scan
4. Pass, Fail, or Script, depending on intended uses. However, intended uses
5. You can have a memory scan which can actually give a person closure if they need a time travel thing. That would be legally okay because you already knew everything there
6. You can have a memory scan (better access to your memories). That can be allowed because you already lived those memories. But they can't be disclosed

Oh, and if it says "Script", here is the important thing to remember:

1. Your brain would need a full instruction manual for what wrinkles in time you could or couldn't adjust, however it would need to be delivered privately and trusted in

You would need to use backwards time travel to help people, not hurt people, and how you'd use it to help yourself depends on if you are using future information for personal gain or profit in a way that makes you rule the world, town, or something else: The "Biff" clause, and yes, the more public and popular it was in the past, and the more unimaginably sentimental to people, the higher the risk. But yes, there is a protection system for memories people don't want to get rid of. A situation where people couldn't imagine life without it. And yes, we are not changing the course of history. And yes, I think once a person reaches their full non-regrettable life, that can't be messed with. And if anyone else's of that involves you, then however way that is couldn't be messed with either.

Algorithm:
Like every law you need to consider being fair to everyone in the world, being safe, preventing long-term consequences in a way that people aren't okay living with, and of course ensuring that no one has to live with the consequences, so if you did something that you didn't like, it would have to be protected if others liked it, or based on what it led to. And yes, when it comes to more popular based event stuff, and memes and trends, that would be protected especially if it essential to someone else's do-over, and so no one would get scared if backwards time travel were created or any uses were allowed.

Oh, and yes. If anyone goes back and messes with the past in any way without proper and GIS approved authorization, they would be sentenced to a lifetime (or at least up to 25 years) in federal prison.

I also assume there are other well-thought out laws regarding backwards time travel, so I think add these to what already would be out there. Thank you.

Now it won't be illegal to:

1. Study backwards time travel
2. Develop GIS technology
3. Ask for a time machine use
4. Create time machines (assuming they are used safely)
5. Have repercussions on if someone did want to turn back in time (just in case the use doesn't work out), however it is still the choice of those people, companies, etc.
6. Invent teleportation technology
7. Send information, data, etc. back in time that isn't dangerous (In fact it is what's best for everyone). So if you were to send information or data back in time, the use would need to be approved to have a positive use

Illegal Time Machine Types:

1. They are a danger to the traveler, or would prove to have side effects
2. The way of getting anything needed for it proves to be a threat to the world or the universe
3. The type of time machine proves to be too risky and would kill the traveler (The type of machine would be legal as long as it is properly tested and will get the traveler to achieve their goal with zero side effects)
4. The only legally approved time machine uses are wormholes (Anything else would be a huge risk)
5. The traveler would need to be a paradox that is allowed to exist, and must be able to outlive when they went back
6. The traveler would need to be convinced everything was all a dream, and cannot have knowledge of any future information unless they were responsible for the creation, and even then it would need to be with their brain development, ideas, etc. at that exact time, so if they created anything, they'd need to remember at the exact right time how it was, and how they contributed

Situations where no one would have to live with the consequences. And if the user posted something that didn’t include anything related to them directly, that post can be done by someone else assuming it integrates into their routine, or they were new and the universe proves to shift in a way that is best for everyone and helpful. But yes, we need to get to a point that is best for everyone and no one has to live with the consequences, that’s how this works.
